

FSD MicroPhotoTherapy (anti-aging) Information

FSD MicroPhotoTherapy is a new, anti-aging device we have added at Contour Dermatology. You might think of it as a gentle IPL laser, although it's not technically a laser. Especially as some skin types can't undergo IPL laser therapy, the FSD technology makes it possible for anyone to enjoy a light-based treatment without the risk of hyperpigmentation.

HOW DOES IT WORK?

FSD uses patented Light and Heat Energy (LHE) which is a non-invasive, non-ablative treatment that does not harm or scar the skin. It uses pulses of light energy to reach deep under the skin and stimulate the growth of new collagen.

WHAT DOES IT TREAT?

FSD helps to soften fine lines and wrinkles, it evens your skin tone and minimizes the appearance of pore size – giving you overall healthier looking skin.

WHICH AREAS CAN THIS TREATMENT BE PERFORMED?

FSD can be performed on the face, neck, décolleté and hands. It's a great treatment to add to your facial.

HOW MANY TREATMENTS WILL BE NEEDED?

Although you can feel and see results after one treatment, six to eight sessions are recommended for best results.

WHAT ARE THE SPECIFIC BENEFITS?

- Reduce fine lines and wrinkles
- Stimulate collagen production
- Increase skin elasticity
- Decrease pore size
- Enhance absorption of creams and lotions
- Even out skin tone
